QuestionAnswer What are the key differences between oxidation and reduction reactions in modern chemistry? Oxidation involves the loss of electrons and an increase in oxidation state, while reduction involves the gain of electrons and a decrease in oxidation state. These processes always occur simultaneously in a redox reaction, with one substance being oxidized and the other reduced.

How can you identify oxidation and reduction in a chemical reaction? Identify changes in oxidation states of elements in the reactants and products. An increase in oxidation state indicates oxidation, whereas a decrease indicates reduction. Also, look for electron transfer indicators such as the addition or removal of oxygen or hydrogen atoms. What are common methods used to balance oxidation-reduction reactions? Common methods include the oxidation number method, the ion-electron method (also called the half-reaction method), and the oxidation-reduction balancing method in acidic or basic solutions. The half-reaction method is widely used for complex redox reactions. Why are oxidation-reduction reactions important in modern chemistry? Redox reactions are fundamental to many processes, including energy production (batteries, fuel cells), metabolic pathways in biology, corrosion, industrial synthesis, and environmental chemistry. Understanding these reactions helps in developing new materials and technologies. What role do oxidizing and reducing agents play in redox reactions? Oxidizing agents are substances that cause oxidation by accepting electrons, while reducing agents cause reduction by donating electrons. For polyatomic ions, the total must match the ion's charge.

Step-by-Step Method for Assigning Oxidation Numbers

Step 1: Identify the Compound Type

Determine whether you are dealing with:

- A neutral compound
- A polyatomic ion

This influences the rules for summation.

Step 2: Assign Known Oxidation Numbers

Apply the basic rules:

Since the sum is zero, the assignments are correct.

Example 2: Oxidation Number of Sulfate Ion (SO₄²⁻)

- Let x be the oxidation number of sulfur (S).
- Oxygen (O): -2, and there are 4 oxygens.

Equation:

$$x + 4(-2) = -2 \text{ (charge of sulfate)}$$

$$x - 8 = -2$$

$$x = +6$$

Result:

Equation:

$$+1 + x + 4(-2) = 0$$

$$+1 + x - 8 = 0$$

$$x = +7$$

Thus, manganese in KMnO₄ has an oxidation number of +7.
