Understanding the properties of these elements and their interactions is crucial for analyzing biological functions.

Molecules and Compounds

Molecules are formed when atoms bond chemically. In biological systems, molecules can be:

- Inorganic molecules: Water (H_2O), salts, gases like oxygen and carbon dioxide.
- Organic molecules: Carbohydrates, lipids, proteins, and nucleic acids, which contain carbon-hydrogen bonds.

Compounds are substances formed from two or more different elements, such as sodium chloride ($NaCl$) or glucose ($C_6H_{12}O_6$).

Chemical Bonds and Reactions

Understanding how atoms combine and interact is vital:

- Ionic bonds: Formed when electrons transfer from one atom to another, creating ions. Example: $NaCl$.
- Covalent bonds: Share electrons between atoms, forming stable molecules. Example: Water (H_2O).
- Hydrogen bonds: Weak attractions between polarized molecules, crucial in stabilizing structures like DNA and proteins.

Chemical reactions in the body include synthesis (building molecules), decomposition (breaking down molecules), and exchange reactions.
